

1) Problem Description:

Develop a Python program that safely calculates the square root of a number provided by the user. Handle exceptions for negative inputs and non-numeric inputs.

Input Format:

User inputs a number.

Output Format:

Print the square root of the number or an error message if an exception occurs.

PROGRAM:

```
import math
```

```
try:
```

```
    a=float(input())
```

```
    if a>=0:
```

```
        b=a**0.5
```

```
        c="%.2f"%b
```

```
        print("The square root of",float(a),"is",c)
```

```
    else:
```

```
        print("Error: Cannot calculate the square root of a negative number.")
```

```
except EOFError:
```

```
    print("Error: could not convert string to float")
```

```
except ValueError:
```

```
    print("Error: could not convert string to float")
```

OUTPUT:

	Input	Expected	Got
✓	16	The square root of 16.0 is 4.00	The square root of 16.0 is 4.00
✓	0	The square root of 0.0 is 0.00	The square root of 0.0 is 0.00
✓	-4	Error: Cannot calculate the square root of a negative number.	Error: Cannot calculate the square root of a negative number.

2) Write a Python program that performs division and modulo operations on two numbers provided by the user. Handle division by zero and non-numeric inputs.

Input Format:

Two lines of input, each containing a number.

Output Format:

Print the result of division and modulo operation, or an error message if an exception occurs.

PROGRAM:

try:

```
a=input()
```

```
b=input()
```

```
c=int(a)/int(b)
```

```
d=int(a)%int(b)
```

except ZeroDivisionError:

```
print("Error: Cannot divide or modulo by zero.")
```

except:

```
print("Error: Non-numeric input provided.")
```

else:

```
print("Division result:",c)
```

```
print("Modulo result:",d)
```

OUTPUT:

	Input	Expected	Got	
✓	10 2	Division result: 5.0 Modulo result: 0	Division result: 5.0 Modulo result: 0	✓
✓	7 3	Division result: 2.3333333333333335 Modulo result: 1	Division result: 2.3333333333333335 Modulo result: 1	✓
✓	8 0	Error: Cannot divide or modulo by zero.	Error: Cannot divide or modulo by zero.	✓
✓	abc 5	Error: Non-numeric input provided.	Error: Non-numeric input provided.	✓

Passed all tests! ✓

3) Develop a Python program that safely performs division between two numbers provided by the user. Handle exceptions like division by zero and non-numeric inputs.

Input Format: Two lines of input, each containing a number.

Output Format: Print the result of the division or an error message if an exception occurs.

PROGRAM:

try:

```
a=input()
```

```
b=input()
```

```
c=float(a)/float(b)
```

except ZeroDivisionError:

```
print("Error: Cannot divide or modulo by zero.")
```

except:

```
print("Error: Non-numeric input provided.")
```

else:

```
print(c)
```

OUTPUT:

	Input	Expected	Got	
✓	10 2	5.0	5.0	✓
✓	10 0	Error: Cannot divide or modulo by zero.	Error: Cannot divide or modulo by zero.	✓
✓	ten 5	Error: Non-numeric input provided.	Error: Non-numeric input provided.	✓

Passed all tests! ✓

4) Write a Python script that asks the user to enter a number within a specified range (e.g., 1 to 100). Handle exceptions for invalid inputs and out-of-range numbers.

Input Format:

User inputs a number.

Output Format:

Confirm the input or print an error message if it's invalid or out of range.

PROGRAM:

try:

```
n=input()
```

```
if(int(n)>0 and int(n)<101):
```

```
    print("Valid input.")
```

```
else:
```

```
    print("Error: Number out of allowed range")
```

except:

```
    print("Error: invalid literal for int()")
```

OUTPUT:

	Input	Expected	Got	
✓	1	Valid input.	Valid input.	✓
✓	100	Valid input.	Valid input.	✓
✓	101	Error: Number out of allowed range	Error: Number out of allowed range	✓

Passed all tests! ✓

5) Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

Input Format: A single line input representing the user's age.

Output Format: Print a message based on the age or an error if the input is invalid.

PROGRAM:

try:

```
a=input()
```

```
if int(a)>=0:
```

```
    print("You are",a,"years old.")
```

```
else:
```

```
    print("Error: Please enter a valid age.")
```

except:

```
    print("Error: Please enter a valid age.")
```

OUTPUT:

	Input	Expected	Got	
✓	twenty	Error: Please enter a valid age.	Error: Please enter a valid age.	✓
✓	25	You are 25 years old.	You are 25 years old.	✓
✓	-1	Error: Please enter a valid age.	Error: Please enter a valid age.	✓
✓	150	You are 150 years old.	You are 150 years old.	✓
✓		Error: Please enter a valid age.	Error: Please enter a valid age.	✓

Passed all tests! ✓
